A LATE IRON AGE BELT BUCKLE FROM ARDEU*

Iosif Vasile FERENCZ**
Cristian Constantin ROMAN***

In the memory of Marius Râza

Starting in 2001, the excavation systematically organized by the Museum from Deva on the Ardeu village, Hunedoara county, continue till today. A lot of items were unearthed and also buildings structures. The Late Iron Age site Ardeu–Cetățuie from the vicinity of the core region of the Dacian Kingdom was identified in the 19th century (1885) by Téglás Gábor – the first director of the Museum from Deva. The systematic research of the site has been initiated by the Museum of Dacian and Roman Civilisation from Deva in 2001. In 2017, on the eastern slope of the Cetățuie Hill the natural erosion brought to light an iron belt buckle. The piece is a part of a sword belt set dated to the LT C2-D1 period; it was made of metal components combined with organic materials (mostly leather). Their presence at Ardeu documents the long distance mobility of artefacts during this period of the Iron Age.

Keywords: iron belt buckle, Ardeu, Late Iron Age, Dacians, connectivity

Cuvinte cheie: cataramă de fier, Ardeu, a doua epocă a fierului, daci, contacte

The Dacian fortress from Ardeu has been systematically researched and constantly presented in the archaeological literature of the last decade.¹ The archaeological site Ardeu–Cetățuie (Fig. 1) is located on the territory of Ardeu village, Balșa commune, Hunedoara County and it comprises the hill with the same name (455 m asl), the plateau situated to the east, the foothills, the terraces positioned towards south and the Ardeu Gorges from the south-western part (Fig. 1–2). The hill with steep slopes is surrounded by the Ardeu Creek, which forms on the northern and western sides a sector of short, picturesque

gorges. The site was inhabited in other historical periods too;² but only discoveries from the Dacian period had been published so far.

The archaeological research of the site started at the end of the 19th century led by Téglás Gábor.³ During the 20th century, because of the stone quarry opened on the territory of the site (Fig. 1) the Museum from Deva and the National History Museum of Romania from Bucharest undertook a small scale excavation in the area, which led to the identification of several metal artefacts.⁴ The systematic research of the site has been initiated by the Museum of Dacian and

Roman Civilisation from Deva in 2001. During the two decades of research further institutions joined the project: the '1 Decembrie 1918' University (Alba Iulia), the National History Museum of Transylvania (Cluj-Napoca), and the Corvin Castle Museum from Hunedoara.⁵

During the 2017 field surveys, on the eastern slope of the Cetățuie Hill (Fig. 2) C. Roman incidentally found an iron object (Fig. 3). The belt buckle was observed on the old path used before 2014 by the research team to reach the top of the hill. In earlier years, other artefacts were also found along the path from the eastern slope.

Almost two decades ago, based on the shape and components of the numerous buckles discovered in four deposits of objects in the Gallic and Gallo-Roman sanctuary at Villeneuve-au-Chatelon (Aube), Gérard Bataille made a representative typological analysis.⁶ The artefact discovered at Ardeu could be interpreted starting from this typology.⁷ The belt buckle was made of an iron bar. The extremity providing the connection with the part made of organic belt material has a triangular shape. It continues in an intermediate part, a 'tongue' made by joining the ends of the iron rod from which the piece was made. The foot is short, and it was made by bending the end of the intermediate part. The termination of the piece is shaped like a spherical button. The piece has been worked by hot hammering until the bar ends were joined, even if the boundary between the two is visible (Pl. I). It is hard to say if this detail is due to the negligence, clumsiness or of the routine of the craftsman who made the object. Although not yet restored, the artefact is well preserved (Museum of Dacian and Roman Civilization in Deva inv. no. 53622).

These type of buckles are components of organic belts, complemented by a garment made of metal fittings (iron and bronze) comprising a buckle and several rings. They are found often in men's graves, and in many cases ensure the

fastening of the belts that support the swords. However, there have also been cases in which the inventory of some graves is missing the scabbard or others in which, although the sword is present, the components of the belt are missing. That is why it can be assumed that such buckles could be also components of belts worn by other people than warriors, and sometimes the swords were hung by belts without metallic elements.⁸

Beginning with the end of the third century BC, and in the second century BC leather belts with iron or bronze rings and buckles begin to replace sword chains made entirely of metal elements.⁹ Their form evolved until the Augustian period, or more precisely until the beginning of the first century AD.¹⁰ According to the Bataille typology the belt buckle from Ardeu can be included in type 2B, which is characterized by V-shaped intermediate part and were dated beginning with the second half of the first century BC.¹¹ Since the belt from Ardeu was discovered incidentally, it can be linked only with reserves to the first horizon of the fortress. It is also hard to determine if it was the buckle of a sword chain or of another type of belt.

¹⁰ BATAILLE 2001, 446–455; fig. 4.

¹¹ BATAILLE 2001, 448, fig. 3–4.

In the eastern Carpathian Basin from the end of the Late Iron Age only a couple of belt buckles are known. At the beginning of the 20th century, two typologically different belt buckles were discovered at Sighișoara–Wietenberg,¹² yet, these Bataille 1A2 type and 4D type belt buckles date from an earlier period than the one found at Ardeu.

Even if weapons and pieces of military equipment in the Late Iron Age are characterized by homogeneity on large areas,¹³ the presence at Ardeu of this type of clothing accessory, with its core region in central and western Europe, indi-

cates the connectivity of the military elite from this region with the western neighbours, and the mobility of individuals, artefacts or technology in the period. These connections are also illustrated by further artefacts found at Ardeu¹⁴ which are specific for the central European areas. The two belt buckles from Sighișoara indicate that these type of belts reached the Carpathian Basin soon after they appeared in the western area, while the piece dated to the end of the first century AD from Ardeu shows the persistence of the contacts between these regions.
